## CALIFORNIA BARLEY AND WHEAT OUTLOOK

E. W. Braun\*

### Summary

The price of barley in California this season (1932) is low relative to the local price of wheat and low relative to the price of barley in the principal grain markets of the middle west. Information now available indicates that the California carryover of barley into 1933 will be very large. Unless, therefore, the 1933 barley crop is unusually short the price of barley for 1933 in this state is likely to remain low relative to the local price of wheat and relative to barley in other markets.

The situation this year arises from the fact that the California barley supply is large as compared to its market outlets. Barley supplies in California were 25 per cent above normal at the beginning of the season. Barley exports of recent months indicate that the export volume for 1932-33 is likely to be materially above the 105,000 ton volume exported last season; but it is doubtful whether the export volume for this season will exceed 200,000 tons. During 1926-1930 exports averaged 248,000 tons. Requirements of barley for feed in this state are little if any above normal. Hog numbers have increased but cattle numbers have decreased.

A carryover of California barley into 1933 of approximately 3 or 4 times a normal amount is in prospect. If this proves to be the case a normal barley crop in 1933 of 737,000 tons from 1,050,000 acres would again bring supplies to approximately 1,000,000 tons. A supply as large as this would almost certainly be accompanied by local barley prices low relative to the local price of wheat and low relative to the price of barley in other markets.

The price of wheat in California is determined by factors outside of the state. Unless international trade in wheat improves or a strong speculative demand develops, no material change in price is to be expected. The wheat supply situation in the United States is somewhat less distressing from a price standpoint than a year ago, and a further reduction in winter wheat acreage for 1933 harvest in the great plains section is in prospect. World supplies, however, are about the same as for the past two years. A reduction in the world wheat acreage is not to be expected.

If a general improvement in business conditions takes place throughout the world, wheat prices are likely to be favorably affected by such improvement before it is reflected in the price of barley.

### California Barley Outlook

The price of barley in California this year (1932) is low relative to the price of wheat in California markets, and is low relative to the price of barley in the grain markets of the middle west. The San Francisco price of feed barley has in recent months (June-Sept.) averaged 64 cents a hundred as compared with \$1.05 a

A study of the price of feed barley relative to the price of milling wheat at San Francisco, as illustrated in figure 1, reveals that this relation is apparently greatly influenced by the supply of barley in California.

Figure 1

Ratio of Barley Price to Wheat Price and California Barley Production Plus Carryover, and Ratio of Barley Acreage to Wheat Acreage in California 1919-1932

Section A of the above diagram represents the price of barley expressed as a per cent of the price of wheat and the supply of California barley at the beginning of each season.

Section B represents the barley acreage of California expressed as a per cent of the wheat acreage; for example, in 1932 the barley acreage was equal to 200 per cent or twice that of wheat. Acreage adjustments warranted by price tend to take place in each of two years following. Acreage adjustment warranted by the low prices in 1925 and 1926 were not completed until 1928. Thus as complete an adjustment in acreage for harvest as is warranted by the present price relationship is not likely to occur in 1933.

hundred for milling wheat. When expressed as a ratio this is equal to 61 per cent. The average ratio since 1920 is 71 per cent. Average prices of feed barley and milling wheat at San Francisco since 1920 are given in table 1. The San Francisco price of feed barley since June 1 has averaged 4 cents under the price of feed barley at Minneapolis, whereas ordinarily the San Francisco price is considerably above the Minneapolis price. Generally the balance between California barley production on the one hand, and domestic feed requirements and export volume on the other, has been such as to place California on a deficit basis for feed barley. As a result the California price has tended to be above the price of barley in surplus areas. Occasionally domestic supplies have exceeded domestic requirements and export demand. When this occurs the California price is placed on a surplus basis. A comparison of the San Francisco price and the Minneapolis price is given in table 1.

Table 1

Prices of Feed Barley and Milling Wheat at San Francisco and Feed Barley at Minneapolis. June-December Averages, 1920-1932

(dollars per hundred)

June to December inclusive	San Francisco Feed barley	San Francisco Milling wheat	San Francisco Price ratio barley to wheat	Minneapolis Feed barley

Weekly issues.

California barley production, carryover, exports, and domestic use, beginning with 1921-22, is given in table 2. In seasons such as 1924 and 1931, when the supply of barley was short, the price of barley nearly equalled the price of wheat. In 1924 the price of feed barley from June to December, inclusive, averaged \$2.21 a hundred and the price of milling wheat averaged \$2.57 a hundred, which when expressed as a ratio is equal to 86. In 1927 the ratio was 83 and in 1931 it was 92, or almost equal to wheat.

Table 2

California Barley Production, Carryover, Exports and Domestic Consumption  
1921-22 - 1932-33

# See crop report of September 10, 1932. Bushels converted to tons at 41.66 bushels per ton.

Sources of data: Production from California Crop Reports.  
Carryover from Grain Trade Association, San Francisco Chamber of Commerce.  
Exports from U. S. Dept. Commerce, Bur. Foreign and Domestic Commerce, San Francisco office. Bushels converted to tons at 41.66 bushels per ton.

In seasons of large supplies of barley relative to requirements the price of barley is low relative to wheat. During the seasons of 1925 and 1926 the ratio was very low, 54 and 53 respectively. The crops were not unduly large but feed requirements had been reduced. Reduced feed requirements were occasioned by a 150,000 head reduction in beef cattle numbers in California. This was partly due to the slaughter made necessary by foot-and-mouth disease, and in part due to a beef-cycle decline in beef cattle numbers. Numbers of hogs in California were also declining in 1925 and 1926. Barley exports in 1925 and 1926 were above average but not sufficiently above average to cause a shortage of feed barley.

This season (1932) the price of barley at San Francisco is again low relative to the price of wheat because California barley supplies exceed domestic feed requirements and export demand. The price ratio has in recent months averaged 61

per cent. Following the harvest of the current year, supplies reached an unusually large volume of slightly over 1,000,000 tons, which is 25 per cent above normal. This large supply is a result of a very large crop of 948,000 tons, as compared with a five year 1926-1930 average of 737,000 tons. Carryover in the 1932 season amounted to 63,000 tons, which is approximately normal. Export volume of California malting barley, though much greater now than during the months immediately following England's abandonment of the gold standard\*\* (see table 3), is still not equal to the volume exported during the same months of the period 1926-1930. In view of the low price of barley, it is probable that exports for 1932-33 may reach 200,000 tons. Domestic utilization for feed and seed during the five years 1926-1930 has averaged 428,000 tons. At present low prices it is probable that domestic utilization may reach 500,000 tons. If this proves to be the case, approximately 700,000 tons will be disposed of, leaving a prospective carryover into 1933 of about 300,000 tons.

Table 3

Barley Exports from San Francisco by Months  
Average 1926-1930 and Monthly since July, 1930

Month	Average 1926-1930	1930-31	1931-32	1932-33

Total	248,372	239,811	105,809	

\* Preliminary.

Source of data: U. S. Dept. of Commerce, Bur. of Foreign and Domestic Commerce. San Francisco Customs District. Mimeographed reports. Bushels converted to tons at 41.66 bushels per ton.

If the acreage for the 1933 harvest is equal to the 1926-1930 average of 1,050,000 acres and average yields are obtained, a harvest of about 737,000 tons may be expected. With a large carryover this would again place supplies above 1,000,000 tons, an amount almost certain to exceed the combined requirements of exports and domestic feed for another season.

---

\*\* England abandoned the gold standard September 21, 1931; a portion of the October exports had been negotiated before that date.

It is unlikely that the price of barley at San Francisco will return to a normal relationship relative to local wheat prices, and relative to barley prices in other markets unless the California barley crop of 1933 is 550,000 tons or less. This estimate allows for a normal carryover of 70,000 tons. With average yields 750,000 acres will produce 550,000 tons. The California Cooperative Crop Reporting Service estimates that 1,246,000 acres were harvested in 1932. The average acreage during the past decade, excluding the very dry years of 1924 and 1931, was 1,050,000 acres. The ratio of barley acreage to wheat acreage harvested in California indicates that when the price of barley goes to levels low relative to wheat in California, as it did in 1920 and 1921 and 1925 and 1926, acreage adjustment takes place through a period of two years following. The ratio of California barley acreage to wheat acreage is given in table 4 and is shown in figure 1.

Table 4

Barley and Wheat Acreage Harvested in California, and  
Ratio of Barley to Wheat Acreage, 1921-1932

Field Crop Reports.

Prices of feed grains in midwestern markets are likely to be higher in 1933 than in 1932 because low prices will tend to reduce acreages planted to feed grains. Furthermore, feed requirements in 1933 are likely to be greater than during the current year because of increased numbers of hogs. Low prices of feed grains this year are in part due to factors arising from the depression and in part to large supplies available this year. The following table gives the estimated production for 1932 of corn, oats, barley, and wheat for the United States, as compared with the production of 1931 and a five year average, 1924-1928 (see table 5). In all except wheat the 1932 production is appreciably above 1931 and in the case of corn and barley, 1932 production is appreciably above the five year average. Prices of barley, corn, and oats at midwestern markets, given in table 6, have declined to a third of the 1924-1928 level.

Table 5

1932 Crops and Markets. Monthly issues.

In view of current low prices of feed grains, it is likely that acreages planted in 1933 will be decreased. The current low prices of feed grains are, however, a stimulus to the increase of livestock numbers, particularly hogs. Hog numbers in the United States on January 1, 1932 were 4,800,000 above the low of 54,374,000 head in 1931. With price ratios still favorable to feeding, it is likely that hog numbers as of January 1, 1933 will show another increase. Unless business activity goes to lower levels, an improvement in feed grain prices at mid-west markets in 1933 as compared with 1932 may therefore be expected, but an equal improvement in the price of barley in California is not likely unless the 1933 barley crop in California is very short.

### California Wheat Outlook

California is dependent upon outside sources for approximately one-half of its wheat supply.\*\* Consequently the price movement of California wheat is determined by conditions outside of the state to a much greater degree than is true in the case of barley. A large proportion of the wheat brought into California comes from the Pacific Northwest; the price of California wheat, therefore, moves more closely with the Portland price than it does with any other market in the United States. Portland in turn, because of its volume of white wheat exports to Europe, reflects changes in the world price of white wheat which is established at Liverpool. Annual average wheat prices at San Francisco, Portland, and Liverpool are given in table 7. For the past ten years the San Francisco price has averaged 17 cents a hundred above Portland.

---

\*\* See Braun, E. W., Wheat, Series on California crops and prices. Calif. Agr. Exp. Sta. Bul. 502:8. 1930.

The 1932 supply of wheat in the United States is materially less than in 1931. According to reports of the United States Department of Agriculture, the 1932 wheat production for the United States is placed at 715,000,000 bushels, which is 179,000,000 bushels under that of last year and 114,000,000 bushels under the five year average 1924-1928. Domestic consumption for 1932-33 is estimated at 660,000,000 bushels. Carryover as of July 1, 1932 was 363,000,000 bushels as compared with 319,000,000 bushels in 1931. Any export volume, therefore, exceeding 85,000,000 bushels will decrease carryover in 1933 as compared to 1932. Total wheat exports, including flour, for the season beginning July, 1930 were 149,000,000 bushels and for 1931 exports totaled 126,000,000 bushels.

Total world wheat supplies are about the same as last year. Wheat production estimates for 1932 in the United States and Canada and the combined total of 34 Northern Hemisphere countries, with comparisons during recent years, are given in table 8. The low prices of recent years have apparently tended to reduce acreage and production in the United States, but no reduction in production is yet apparent for the Northern Hemisphere as a whole. In the wheat importing countries of Continental Europe wheat production is being stimulated by means of import duties and milling restrictions on foreign wheat. Probable future production in Russia is not at present predictable.

Table 8

Wheat Production in 34 Northern Hemisphere Countries  
1928-1932

\* August, 1932 intentions to plant.

Sources of data: 1924-1929 U. S. Dept. Agr., Yearbook of Agriculture, 1932:579.  
1930-1932 U. S. Dept. Agr., Bur. Agr. Econ. Crops and Markets.

The report on intentions to plant winter wheat this fall indicates another reduction in winter wheat acreage. Contraction in wheat acreage similar to that of the United States is not apparent in other important wheat producing countries. It would appear, therefore, that unless international trade in wheat improves or an important speculative demand for wheat appears, no major change in the price of wheat in 1933 as compared with 1932 is now to be expected. If a world wide improvement in business conditions occurs, it will stimulate international trade in wheat.
